- Low Supply-Voltage Range, 1.8 V to 3.6 V
- Ultralow-Power Consumption:
 - Active Mode: 270 μA at 1 MHz, 2.2 V
 - Standby Mode: 0.7 μA
 - Off Mode (RAM Retention): 0.1 μA
- Ultrafast Wake-Up From Standby Mode in Less Than 1 μs
- 16-Bit RISC Architecture,
 62.5 ns Instruction Cycle Time
- Hardware Multiplier
- Basic Clock Module Configurations:
 - Internal Frequencies up to 16MHz With Four Calibrated Frequencies to ±1%
 - Internal Very Low Power LF Oscillator
 - 32-kHz Crystal
 - High-Frequency Crystal up to 16 MHz
 - Resonator
 - External Digital Clock Source
 - External Resistor
- 16-Bit Timer_A With Three Capture/Compare Registers
- 16-Bit Timer_B With Three Capture/Compare Registers
- On-Chip Comparator for Analog Signal Compare Function or Slope A/D Conversion

- Universal Serial Communication Interface
 - Enhanced UART Supporting Auto Baudrate Detection (LIN)
 - IrDA Encoder and Decoder
 - Synchronous SPI
 - I²C™
- Brownout Detector
- Serial Onboard Programming,
 No External Programming Voltage Needed
 Programmable Code Protection by
 Security Fuse
- Bootstrap Loader in Flash Devices
- On-Chip Emulation Module
- Family Members Include: MSP430F2330

8KB + 256B Flash Memory 1KB RAM

MSP430F2350

16KB + 256B Flash Memory 2KB RAM

MSP430F2370

32KB + 256B Flash Memory 2KB RAM

- Available in 40-pin QFN Package
- For Complete Module Descriptions, See the MSP430x2xx Family User's Guide

description

The Texas Instruments MSP430 family of ultralow-power microcontrollers consists of several devices featuring different sets of peripherals targeted for various applications. The architecture, combined with five low-power modes is optimized to achieve extended battery life in portable measurement applications. The devices feature a powerful 16-bit RISC CPU, 16-bit registers, and constant generators that contribute to maximum code efficiency. The digitally controlled oscillator (DCO) allows wake-up from low-power modes to active mode in less than 1 us.

The MSP430F23x0 series is an ultralow-power microcontroller with two built-in 16-bit timers, one universal serial communication interface (USCI), a versatile analog comparator, and 32 I/O pins.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications. These devices have limited built-in ESD protection.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

AV _{CC}	40		Analog supply voltage, positive terminal	
QFN Pad	NA	NA	QFN package pad connection to D/AV _{SS} recommended	

short-form description

CPU

The MSP430 CPU has a 16-bit RISC architecture that is highly transparent to the application. All operations, other than program-flow instructions, are performed as register operations in conjunction with seven addressing modes for source operand and four addressing modes for destination operand.

The CPU is integrated with 16 registers that provide reduced instruction execution time. The register-to-register operation execution time is one cycle of the CPU clock.

Four of the registers, R0 to R3, are dedicated as program counter, stack pointer, status register, and constant generator respectively. The remaining registers are general-purpose registers.

Peripherals are connected to the CPU using data, address, and control buses, and can be handled with all instructions.

instruction set

The instruction set consists of 51 instructions with three formats and seven address modes. Each instruction can operate on word and byte data. Table 1 shows examples of the three types of instruction formats; the address modes are listed in Table 2.

Table 1. Instruction Word Formats

Dual operands, source-destination	e.g. ADD R4,R5	R4 + R5> R5
Single operands, destination only	e.g. CALL R8	PC>(TOS), R8> PC
Relative jump, un/conditional	e.g. JNE	Jump-on-equal bit = 0

Table 2. Address Mode Descriptions

ADDRESS MODE	s	D	SYNTAX	EXAMPLE	OPERATION
Register	•	•	MOV Rs,Rd	MOV R10,R11	R10> R11
Indexed	•	•	MOV X(Rn),Y(Rm)	MOV 2(R5),6(R6)	M(2+R5)> M(6+R6)
Symbolic (PC relative)	•	•	● MOV EDE,TONI		M(EDE)> M(TONI)
Absolute	•	•	MOV &MEM,&TCDAT		M(MEM)> M(TCDAT)
Indirect	•		MOV @Rn,Y(Rm)	MOV @R10,Tab(R6)	M(R10)> M(Tab+R6)
Indirect autoincrement	•		$M(OV/(a)Rn \perp Rm = I = M(OV/(a)R10 \perp R11 = I = V$		M(R10)> R11 R10 + 2> R10
Immediate	•		MOV #X,TONI	MOV #45,TONI	#45> M(TONI)

NOTE : S = source D = destination

operating modes

The MSP430 has one active mode and five software selectable low-power modes of operation. An interrupt event can wake up the device from any of the five low-power modes, service the request and restore back to the low-power mode on return from the interrupt program.

The following six operating modes can be configured by software:

- Active mode (AM)
 - All clocks are active
- Low-power mode 0 (LPM0)
 - CPU is disabled ACLK and SMCLK remain active, MCLK is disabled
- Low-power mode 1 (LPM1)
 - CPU is disabled
 ACLK and SMCLK remain active, MCLK is disabled
 DCO's dc-generator is disabled if DCO not used in active mode
- Low-power mode 2 (LPM2)
 - CPU is disabled
 MCLK and SMCLK are disabled
 DCO's dc-generator remains enabled
 ACLK remains active
- Low-power mode 3 (LPM3)
 - CPU is disabled
 MCLK and SMCLK are disabled
 DCO's dc-generator is disabled
 ACLK remains active
- Low-power mode 4 (LPM4)
 - CPU is disabled
 ACLK is disabled
 MCLK and SMCLK are disabled
 DCO's dc-generator is disabled
 Crystal oscillator is stopped

interrupt vector addresses

The interrupt vectors and the power-up starting address are located in the address range 0xFFFF-0xFFC0. The vector contains the 16-bit address of the appropriate interrupt-handler instruction sequence.

INTERRUPT SOURCE	INTERRUPT FLAG	SYSTEM INTERRUPT	WORD ADDRESS	PRIORITY
Power-up External Reset Watchdog Flash key violation PC out of range (see Note 1)	PORIFG RSTIFG WDTIFG KEYV (see Note 2)	Reset	0xFFFE	31, highest
NMI Oscillator Fault Flash memory access violation	NMIIFG OFIFG ACCVIFG (see Notes 2 & 6)	(non)-maskable (non)-maskable (non)-maskable	0xFFFC	30
Timer_B3	TBCCR0 CCIFG (see Note 3)	maskable	0xFFFA	29
Timer_B3	TBCCR1 and TBCCR2, CCIFGs, TBIFG (see Notes 2 & 3)	maskable	0xFFF8	28
Comparator_A+	CAIFG	maskable	0xFFF6	27

Timer_A3	TACCR0 CCIFG (see Note 3)	maskable	0xFFF2	25
Timer_A3	TACCR1 CCIFG, TACCR2 CCIFG, TAIFG (see Notes 2 & 3)	maskable	0xFFF0	24
USCI_A0/USCI_B0 Receive USCI_B0 I2C Status	UCA0RXIFG, UCB0RXIFG (see Note 2 and 4)	maskable	0xFFEE	23
USCI_A0/USCI_B0 Transmit USCI_B0 I2C Receive / Transmit	UCA0TXIFG, UCB0TXIFG (see Note 2 and 5)	maskable	0xFFEC	22
			0xFFEA	21
			0xFFE8	20
I/O port P2 (eight flags)	P2IFG.0 to P2IFG.7 (see Notes 2 & 3)	maskable	0xFFE6	19
I/O port P1 (eight flags)	P1IFG.0 to P1IFG.7 (see Notes 2 & 3)	maskable	0xFFE4	18
			0xFFE2	17
			0xFFE0	16
(see Note 7)			0xFFDE	15
(see Note 8)			0xFFDC-0xFFC0	14-0, lowest

NOTES: 1. A reset is executed if the CPU tries to fetch instructions from within the module register memory address range (0x0000-0x01FF).

- 2. Multiple source flags.
- 3. Interrupt flags are located in the module.
- 4. In SPI mode: UCB0RXIFG. In I2C mode: UCALIFG, UCNACKIFG, ICSTTIFG, UCSTPIFG.
- 5. In UART/SPI mode: UCB0TXIFG. In I2C mode: UCB0RXIFG, UCB0TXIFG.
- 6. Non-maskable: the individual interrupt-enable bit can disable an interrupt event, but the general-interrupt enable cannot. Non-maskable: neither the individual nor the general interrupt-enable bit will disable an interrupt event.
- 7. This location is used as bootstrap loader security key (BSLSKEY).
 - A 0xAA55 at this location disables the BSL completely.
 - A zero (0h) disables the erasure of the flash if an invalid password is supplied.
- 8. The interrupt vectors at addresses 0xFFDC to 0xFFC0 are not used in this device and can be used for regular program code if necessary.

special function registers

Most interrupt and module-enable bits are collected in the lowest address space. Special-function register bits not allocated to a functional purpose are not physically present in the device. This arrangement provides simple software access.

bootstrap loader (BSL)

The MSP430 bootstrap loader (BSL) enables users to program the flash memory or RAM using a UART serial interface. Access to the MSP430 memory via the BSL is protected by user-defined password. For complete description of the features of the BSL and its implementation, see the Application report *Features of the MSP430 Bootstrap Loader*, Literature Number SLAA089.

BSL Function	RHA Package Pins
Data Transmit	5 - P1.1
Data Receive	14 - P2.2

flash memory

The flash memory can be programmed via the JTAG port, the bootstrap loader, or in-system by the CPU. The CPU can perform single-byte and single-word writes to the flash memory. Features of the flash memory include:

- Flash memory has n segments of main memory and four segments of information memory (A to D) of 64 bytes each. Each segment in main memory is 512 bytes in size.
- Segments 0 to n may be erased in one step, or each segment may be individually erased.
- Segments A to D can be erased individually, or as a group with segments 0-n.
 Segments A to D are also called *information memory*.
- Segment A contains calibration data. After reset segment A is protected against programming or erasing.
 It can be unlocked but care should be taken not to erase this segment if the calibration data is required.

peripherals

Peripherals are connected to the CPU through data, address, and control busses and can be handled using all instructions. For complete module descriptions, refer to the MSP430x2xx Family User's Guide.

oscillator and system clock

The clock system is supported by the basic clock module that includes support for a 32768-Hz watch crystal oscillator, an internal very low power, low frequency oscillator, an internal digitally-controlled oscillator (DCO) and a high frequency crystal oscillator. The basic clock module is designed to meet the requirements of both low system cost and low-power consumption. The internal DCO provides a fast turn-on clock source and stabilizes in less than 1 µs. The basic clock module provides the following clock signals:

- Auxiliary clock (ACLK), sourced from a 32768-Hz watch crystal, a high frequency crystal or the internal very low power LF oscillator.
- Main clock (MCLK), the system clock used by the CPU.
- Sub-Main clock (SMCLK), the sub-system clock used by the peripheral modules.

The DCO settings to calibrate the DCO output frequency are stored in the information memory segment A.

DCO Calibration	Data (provided from fac	tory in flash info men	nory segment A)
DCO Frequency	Calibration Register	Size	Address
1 MHz	CALBC1_1MHZ	byte	0x10FF
	CALDCO_1MHZ	byte	0x10FE
8 MHz	CALBC1_8MHZ	byte	0x10FD
	CALDCO_8MHZ	byte	0x10FC
12 MHz	CALBC1_12MHZ	byte	0x10FB
	CALDCO_12MHZ	byte	0x10FA
16 MHz	CALBC1_16MHZ	byte	0x10F9
	CALDCO_16MHZ	byte	0x10F8

brownout

The brownout circuit is implemented to provide the proper internal reset signal to the device during power on and power off.

digital I/O

There are 4 8-bit I/O ports implemented—ports P1 through P4:

- All individual I/O bits are independently programmable.
- Any combination of input, output, and interrupt conditions is possible.
- Edge-selectable interrupt input capability for all the eight bits of ports P1 and P2.
- Read/write access to port-control registers is supported by all instructions.
- Each I/O has an individually programmable pull-up/pull-down resistor.

The MSP430F23x0 devices provide 32 total port I/O pins available externally. Please see the device pinout for more information.

watchdog timer +

The primary function of the watchdog timer (WDT+) module is to perform a controlled system restart after a software problem occurs. If the selected time interval expires, a system reset is generated. If the watchdog function is not needed in an application, the module can be configured as an interval timer and can generate interrupts at selected time intervals.

hardware multiplier

The multiplication operation is supported by a dedicated peripheral module. The module performs 16×16 , 16×8 , 8×16 , and 8×8 bit operations. The module is capable of supporting signed and unsigned multiplication as well as signed and unsigned multiply and accumulate operations. The result of an operation can be accessed immediately after the operands have been loaded into the peripheral registers. No additional clock cycles are required.

comparator_A+

The primary function of the comparator_A+ module is to support precision slope analog-to-digital conversions, battery-voltage supervision, and monitoring of external analog signals.

timer A3

Timer_A3 is a 16-bit timer/counter with three capture/compare registers. Timer_A3 can support multiple capture/compares, PWM outputs, and interval timing. Timer_A3 also has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers.

USCI

The universal serial communication interface (USCI) module is used for serial data communication. The USCI module supports synchronous communication protocols like SPI (3 or 4 pin), I2C and asynchronous communication protocols like UART, enhanced UART with automatic baudrate detection (LIN), and IrDA.

USCI A0 provides support for SPI (3 or 4 pin), UART, enhanced UART and IrDA.

USCI B0 provides support for SPI (3 or 4 pin) and I2C.

absolute maximum ratings (see Note 1)

NOTES: 1. Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

- 2. All voltages referenced to V_{SS}. The JTAG fuse-blow voltage, V_{FB}, is allowed to exceed the absolute maximum rating. The voltage is applied to the TDI/TCLK pin when blowing the JTAG fuse.
- 3. Higher temperature may be applied during board soldering process according to the current JEDEC J-STD-020 specification with peak reflow temperatures not higher than classified on the device label on the shipping boxes or reels.

recommended operating conditions

PARAMETER		MIN	NOM	MAX	UNITS
Supply voltage during program execution, V _{CC}	AV _{CC} = DV _{CC} = V _{CC} (see Note 1)	1.8		3.6	V
Supply voltage during flash memory programming, V _{CC}	AV _{CC} = DV _{CC} = V _{CC} (see Note 1)	2.2		3.6	V
Supply voltage, V _{SS}	$AV_{SS} = DV_{SS} = V_{SS}$	0.0		0.0	V
Occupies for eight and a many T	I Version	-40		3.6 3.6	°C
Operating free-air temperature range, T _A	T Version	-40			°C
Processor frequency f _{SYSYTEM} (Maximum MCLK frequency) (see Notes 2, 3 and Figure 1)	V _{CC} = 1.8 V, Duty Cycle = 50% ±10%	dc		4.15	
	V _{CC} = 2.7 V, Duty Cycle = 50% ±10%	dc		12	MHz
	V _{CC} ≥ 3.3 V, Duty Cycle = 50% ±10%	dc		16	

- NOTES: 1. It is recommended to power AV_{CC} and DV_{CC} from the same source. A maximum difference of 0.3 V between AV_{CC} and DV_{CC} can be tolerated during power-up and operation.
 - The MSP430 CPU is clocked directly with MCLK.Both the high and low phase of MCLK must not exceed the pulse width of the specified maximum frequency.
 - 3. Modules might have a different maximum input clock specification. See the specification of the respective module in this datasheet.

NOTE: Minimum processor frequency is defined by system clock. Flash program or erase operations require a minimum V_{CC} of 2.2 V.

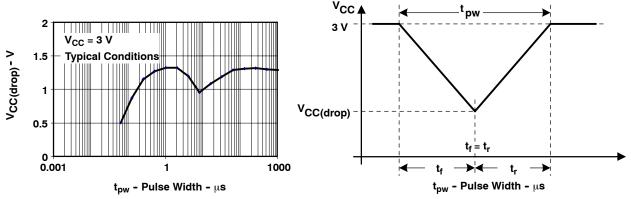

Figure 10. V_{CC(drop)} Level With a Triangle Voltage Drop to Generate a POR/Brownout Signal

electrical characteristics over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted) (continued)

main DCO characteristics

- All ranges selected by RSELx overlap with RSELx + 1: RSELx = 0 overlaps RSELx = 1, ... RSELx = 14 overlaps RSELx = 15.
- DCO control bits DCOx have a step size as defined by parameter S_{DCO}.
- Modulation control bits MODx select how often f_{DCO(RSEL,DCO+1)} is used within the period of 32 DCOCLK cycles. The frequency f_{DCO(RSEL,DCO)} is used for the remaining cycles. The frequency is an average equal to:

$$f_{average} = \frac{32 \times f_{DCO(RSEL,DCO)} \times f_{DCO(RSEL,DCO+1)}}{MOD \times f_{DCO(RSEL,DCO)} + (32 - MOD) \times f_{DCO(RSEL,DCO+1)}}$$

DCO frequency

		XTS = 0, XCAPx = 0			1		pF
	Integrated effective load	XTS = 0, XCAPx = 1			5.5		pF
$C_{L,eff}$	capacitance, LF mode (see Note 1)	XTS = 0, XCAPx = 2			8.5		pF
	,	XTS = 0, XCAPx = 3			11		pF
Duty cycle	LF mode	XTS = 0, Measured at P1.4/ACLK, f _{LFXT1,LF} = 32,768Hz	2.2 V/3 V	30	50	70	%
f _{Fault,LF}	Oscillator fault frequency, LF mode (see Note 3)	XTS = 0, XCAPx = 0. LFXT1Sx = 3 (see Note 2)	2.2 V/3 V	10		10,000	Hz

NOTES: 1. Includes parasitic bond and package capacitance (approximately 2 pF per pin).

Since the PCB adds additional capacitance it is recommended to verify the correct load by measuring the ACLK frequency. For a correct setup the effective load capacitance should always match the specification of the used crystal.

- 2. Measured with logic level input frequency but also applies to operation with crystals.
- 3. Frequencies below the MIN specification will set the fault flag, frequencies above the MAX specification will not set the fault flag. Frequencies in between might set the flag.
- 4. To improve EMI on the LFXT1 oscillator the following guidelines should be observed.
 - Keep as short of a trace as possible between the device and the crystal.
 - Design a good ground plane around the oscillator pins.
 - Prevent crosstalk from other clock or data lines into oscillator pins XIN and XOUT.
 - Avoid running PCB traces underneath or adjacent to the XIN and XOUT pins.
 - Use assembly materials and praxis to avoid any parasitic load on the oscillator XIN and XOUT pins.
 - If conformal coating is used, ensure that it does not induce capacitive/resistive leakage between the oscillator pins.
 - Do not route the XOUT line to the JTAG header to support the serial programming adapter as shown in other documentation. This signal is no longer required for the serial programming adapter.

internal very low power, low frequency oscillator (VLO)

	PARAMETER	TEST CONDITIONS	VCC	MIN	TYP	MAX	UNIT
f_{VLO}	VLO frequency		2.2 V/3 V	4	12	20	kHz
df _{VLO} /dT	VLO frequency temperature drift	(See Note 1)	2.2 V/3 V		0.5		%/°C
df _{VLO} /dV _{CC}	VLO frequency supply voltage drift	(See Note 2)	1.8V - 3.6V		4		%/V

NOTES: 1. Calculated using the box method:

NOTES: 1. Includes parasitic bond and package capacitance (approximately 2 pF per pin).

Since the PCB adds additional capacitance it is recommended to verify the correct load by measuring the ACLK frequency. For a correct setup the effective load capacitance should always match the specification of the used crystal.

- 2. Requires external capacitors at both terminals. Values are specified by crystal manufacturers.
- 3. Measured with logic level input frequency but also applies to operation with crystals.
- 4. Frequencies below the MIN specification will set the fault flag, frequencies above the MAX specification will not set the fault flag. Frequencies in between might set the flag.
- 5. To improve EMI on the LFXT1 oscillator the following guidelines should be observed.
 - Keep as short of a trace as possible between the device and the crystal.
 - Design a good ground plane around the oscillator pins.
 - Prevent crosstalk from other clock or data lines into oscillator pins XIN and XOUT.
 - Avoid running PCB traces underneath or adjacent to the XIN and XOUT pins.
 - Use assembly materials and praxis to avoid any parasitic load on the oscillator XIN and XOUT pins.
 - If conformal coating is used, ensure that it does not induce capacitive/resistive leakage between the oscillator pins.
 - Do not route the XOUT line to the JTAG header to support the serial programming adapter as shown in other documentation. This signal is no longer required for the serial programming adapter.

electrical characteristics over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted) (continued)

Comparator_A+ (see Note 1)

	PARAMETER	TEST CONDITIONS	VCC	MIN	TYP	MAX	UNIT
1		CAON=1, CARSEL=0, CAREF=0	2.2 V		25	40	μΑ
I _(DD)		CAON=1, CANSEL=0, CANEF=0	3 V		45	60	μΑ
		CAON=1, CARSEL=0,			30	50	
(Refladder/Ref	Diode)	CAREF=1/2/3, no load at P1.0/CA0 and P1.1/CA1	3 V		45	71	μΑ
V _(IC)	Common-mode input voltage	CAON=1	2.2 V/3 V	0		V _{CC} -1	V
V _(Ref025)	Voltage @ 0.25 V _{CC} node	PCA0=1, CARSEL=1, CAREF=1, no load at P1.0/CA0 and P1.1/CA1	2.2 V/3 V	0.23	0.24	0.25	
V _(Ref050)	Voltage @ 0.5V _{CC} node	PCA0=1, CARSEL=1, CAREF=2, no load at P1.0/CA0 and P1.1/CA1	2.2 V/3 V	0.47	0.48	0.5	
V	(see Figure 27 and Figure 28)	PCA0=1, CARSEL=1, CAREF=3, no load at P1.0/CA0 and P1.1/CA1, T _A = 85°C	2.2 V	390	480	540	mV
V _(RefVT)	(See Figure 27 and Figure 26)		3 V	400	490	550	IIIV
V _(offset)	Offset voltage	See Note 2	2.2 V/3 V	-30		30	mV
V _{hys}	Input hysteresis	CAON=1	2.2 V/3 V	0	0.7	1.4	mV
		T _A = 25°C, Overdrive 10 mV, Without filter: CAF=0	2.2 V	80	165	300	ns
+,	Response time	(see Note 3, Figure 24 and Figure 25)	3 V	70	120	240	113
^t (response)	(low-high and high-low)	T _A = 25°C, Overdrive 10 mV, With filter: CAF=1	2.2 V	1.4	1.9	2.8	μS
		(see Note 3, Figure 24 and Figure 25)	3 V	0.9	1.5	2.2	μ5

NOTES: 1. The leakage current for the Comparator_A+ terminals is identical to $I_{lkg(Px.x)}$ specification.

3. Response time measured at P1.3/CAOUT.

^{2.} The input offset voltage can be cancelled by using the CAEX bit to invert the Comparator_A+ inputs on successive measurements. The two successive measurements are then summed together.

Flash Memory

	PARAMETER	TEST CONDITIONS	vcc	MIN	TYP	MAX	UNIT
V _{CC(PGM/} ERASE)	Program and erase supply voltage			2.2		3.6	V
f _{FTG}	Flash Timing Generator frequency			257		476	kHz
I _{PGM}	Supply current from V _{CC} during program		2.2 V/3.6 V		1	5	mA
I _{ERASE}	Supply current from V _{CC} during erase		2.2 V/3.6 V		1	7	mA
t _{CPT}	Cumulative program time (see Note 1)		2.2 V/3.6 V			10	ms
t _{CMErase}	Cumulative mass erase time		2.2 V/3.6 V	20			ms
	Program/erase endurance			10 ⁴	10 ⁵		cycles
t _{Retention}	Data retention duration	$T_J = 25^{\circ}C$		100			years
t _{Word}	Word or byte program time				30		
t _{Block, 0}	Block program time for first byte or word	1			25		
t _{Block, 1-63}	Block program time for each additional byte or word				18		١.
t _{Block, End}	Block program end-sequence wait time	see Note 2			6		t _{FTG}
t _{Mass Erase}	Mass erase time]			10593		
t _{Seg Erase}	Segment erase time				4819		

NOTES: 1. The cumulative program time must not be exceeded when writing to a 64-byte flash block. This parameter applies to all programming methods: individual word/byte write and block write modes.

2. These values are hardwired into the Flash Controller's state machine ($t_{FTG} = 1/f_{FTG}$).

RAM

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
V _(RAMh)	RAM retention supply voltage (see Note)	CPU halted	1.6			٧

NOTE: This parameter defines the minimum supply voltage V_{CC} when the data in RAM remains unchanged. No program execution should happen during this supply voltage condition.

JTAG Interface

	PARAMETER	TEST CONDITIONS	V _{CC}	MIN	NOM	MAX	UNIT
,	TOK	see Note 1	2.2 V	0		5	MHz
†TCK	TCK input frequency		3 V	0		10	MHz
R _{Internal}	Internal pullup resistance on TMS, TCK, TDI/TCLK	see Note 2	2.2 V/ 3 V	20	35	55	kΩ

NOTES: 1. f_{TCK} may be restricted to meet the timing requirements of the module selected.

2. TMS, TDI/TCLK, and TCK pull-up resistors are implemented in all versions.

JTAG Fuse (see Note)

	PARAMETER	TEST CONDITIONS	V _{CC}	MIN	NOM	MAX	UNIT
V _{CC(FB)}	Supply voltage during fuse-blow condition	T _A = 25°C		2.5			V
V_{FB}	Voltage level on TDI/TCLK for fuse-blow: F versions			6		7	V
I _{FB}	Supply current into TDI/TCLK during fuse blow					100	mA
t _{FB}	Time to blow fuse					1	ms

NOTE: Once the fuse is blown, no further access to the MSP430 JTAG/Test and emulation features is possible. The JTAG block is switched to bypass mode.

APPLICATION INFORMATION

JTAG pins TMS, TCK, TDI/TCLK, TDO/TDI, input/output with Schmitt-trigger

During Programming Activity and During Blowing of the Fuse, Pin TDO/TDI Is Used to Apply the Test Input Data for JTAG Circuitry

SLAS518A - AUGUST 2006 - REVISED MAY 2007

APPLICATION INFORMATION

JTAG fuse check mode

MSP430F23x0 devices that have the fuse on the TDI/TCLK terminal have a fuse check mode that tests the continuity of the fuse the first time the JTAG port is accessed after a power-on reset (POR). When activated, a fuse check current, I_{TF} , of 1 mA at 3 V, 2.5 mA at 5 V can flow from the TDI/TCLK pin to ground if the fuse is not burned. Care must be taken to avoid accidentally activating the fuse check mode and increasing overall system power consumption.

Activation of the fuse check mode occurs with the first negative edge on the TMS pin after power up or if the TMS is being held low during power up. The second positive edge on the TMS pin deactivates the fuse check mode. After deactivation, the fuse check mode remains inactive until another POR occurs. After each POR the fuse check mode has the potential to be activated.

The fuse check current will only flow when the fuse check mode is active and the TMS pin is in a low state (see Figure 30). Therefore, the additional current flow can be prevented by holding the TMS pin high (default condition).

Figure 30. Fuse Check Mode Current

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

NOTES: A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M—1994.

- B. This drawing is subject to change without notice.
- C. QFN (Quad Flatpack No—Lead) Package configuration.
- The package thermal pad must be soldered to the board for thermal and mechanical performance. See the Product Data Sheet for details regarding the exposed thermal pad dimensions.
- E. Package complies to JEDEC MO-220 variation VJJD-2.

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No—Lead (QFN) package and its advantages, refer to Application Report, Quad Flatpack No—Lead Logic Packages, Texas Instruments Literature No. SCBA017. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

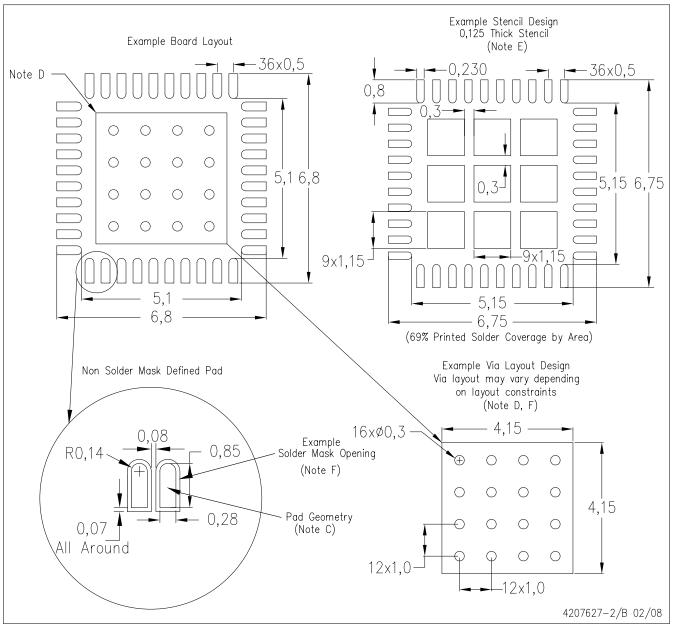

Bottom View

NOTES:

- 1) All linear dimensions are in millimeters
- 2) The Pin 1 Identification mark is an optional feature that may be present on some devices In addition, this Pin 1 feature if present is electrically connected to the center thermal pad and therefore should be considered when routing the board layout.

Exposed Thermal Pad Dimensions

RHA (S-PQFP-N40)

NOTES:

- A. All linear dimensions are in millimeters.
- B. This drawing is subject to change without notice.
- C. Publication IPC-7351 is recommended for alternate designs.
- D. This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat—Pack Packages, Texas Instruments Literature No. SCBA017, SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com http://www.ti.com.
- E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
- F. Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting recommendations for vias placed in the thermal pad.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
